1. Overview

The Side-channel Attack Standard Evaluation Board (SASEBO) is an FPGA board specifically designed to develop standard evaluation schemes to secure the cryptographic module against physical attacks. The basic features of SASEBO are as follows:

- 250 mm x 200 mm x 1.6 mm, FR-4, eight layers.
- Two Xilinx Virtex-II pro series FPGAs.
 - Target FPGA : XC2VP7-5FG456C for cryptographic circuits
 - Control FPGA : XC2VP30-5FG676C for board control
- 32-bit local bus between the FPGAs.
- One RS-232 port.
- 24 MHz oscillator for each FPGA.
- Two 3.3V DC power supply lines.
 - Internal regulators provide 2.5V, 1.8V, and 1.6V DC powers.
- An alternative power supply line for the target FPGA is supported to directly input 1.5–1.7V.
- Shunt resistors can be inserted to VDD and GND lines to measure the power consumptions of the FPGAs.

3. Block Diagram

4. Operational Instructions

4.1. Board Setting

4.1.1. Power supply

The 3.3V DC power is supplied from the connectors CN2 and CN4.

CN2: Target FPGA power supply

CN4: Control FPGA power supply

Pin assignments for the connectors CN2 and CN4 are given below.

CN2, CN4	Pin 1: DC 3.3V
	Pin 2: GND
	Pin 3: NC

DC 1.5-1.7V power can be supplied to the target FPGA directly from connector CN5 without using the voltage regulators on the board. **Configuration switch SW3 must be set properly.** (See Section 4.1.2)

The pin assignment of CN5 is given below.

CN5	Pin 1: DC 1.5-1.7V
	Pin 2: GND
	Pin 3: NC

After supplying power sources to the connectors CN2 and CN4, turn on the main power switch SW1. Then the LEDs D1 and D3 indicate the status of power supplied to the target FPGA and control FPGA as follows.

- D1: Power is supplied to the target FPGA.
- D3: Power is supplied to the control FPGA.

4.1.2. Setting of power source for the target device

The power source for the target FPGA can be selected from the internal regulator and the external power supply (CN5) by setting SW3 as follows.

SW3	INT: The internal regulator is used.
	EXT: An external power supply connected to CN5 is used.

NOTE: **Do not toggle SW3** while power is supplied to the board.

4.1.3. Setting of power sequence for the FPGA I/O

The power sequence of the target FPGA and control FPGA are configured using jumper pins JP4, JP7, and JP2.

JP4: Set the target FPGA power sequence.

- Open: Power is supplied from CN2 when the voltage becomes stable. (default)
- Short: Power sequence control is disabled and power is supplied directly from CN2.

JP7: Set the control FPGA power sequence.

- Open: Power supplied from CN4 is controlled by the JP2 setting. (default)
- Short: The power sequence control of CN4 is disabled. The power is supplied directly.

JP2: Set CN4 power sequence

Power is supplied from CN4 when the output voltage of the 2.5V regulator becomes stable. (default)

Power is supplied from CN4 when the output voltage of the 1.5V regulator becomes stable.

4.1.4. Setting for the FPGA configuration sequence

The configuration sequence for each FPGA is controlled using JP1 and JP6.

JP1: Setting of the configuration sequence for the target FPGA.

FPGA configuration starts when the output voltage of the 2.5V regulator becomes stable.
(default)

FPGA configuration starts when the output voltage of the 1.5V regulator becomes stable.

JP6: Setting of the configuration sequence for the control FPGA.

FPGA configuration starts when the output voltage of the 2.5V regulator becomes stable.
(default)

FPGA configuration starts when the output voltage of the 1.5V regulator becomes stable.

4.1.5. Setting of the bypass jumper of the shunt resistors

Shunt resistors are mounted to measure the power consumed by the FPGAs as voltage drop, but they can be bypassed using jumpers JP3, JP8, and JP10 as follows.

JP3: Setting for shunt resistor R2 inserted to the 1.5V VDD line of the target FPGA core.

JP8: Setting for shunt resistor R114 inserted to the GND line of the target FPGA.

JP10: Setting for shunt resistor R125 inserted to the 1.5V VDD line of the control FPGA core.

Open: Shunt resistor is enabled. (default)

Short: Shunt resistor is bypassed.

NOTE: **Keep JP5 and JP11 OPEN for the default setting.** The board will be seriously damaged if JP5 or JP11 is shorted.

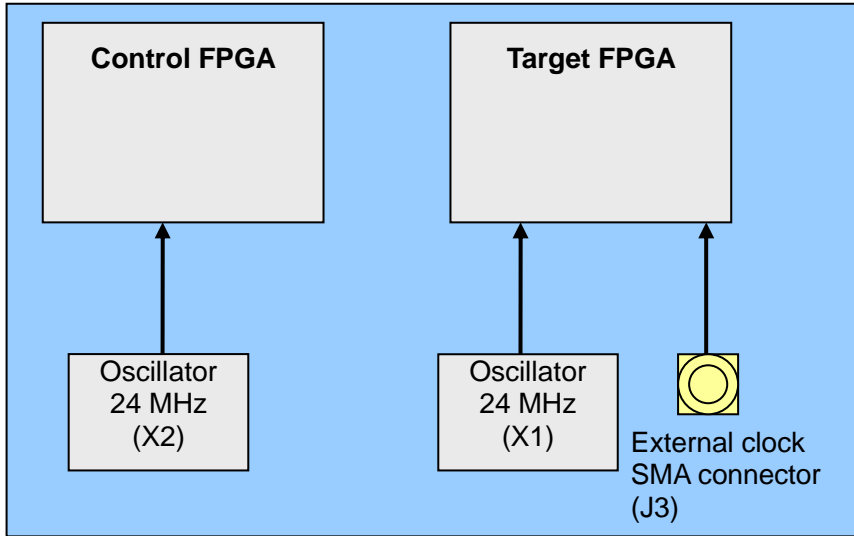

4.2. Clock Sources

Two 24-MHz oscillators are implemented for the FPGAs, and the system clocks can be monitored at TP26, J4, and TP15.

TP26, J4: The 24 MHz clock for the control FPGA.

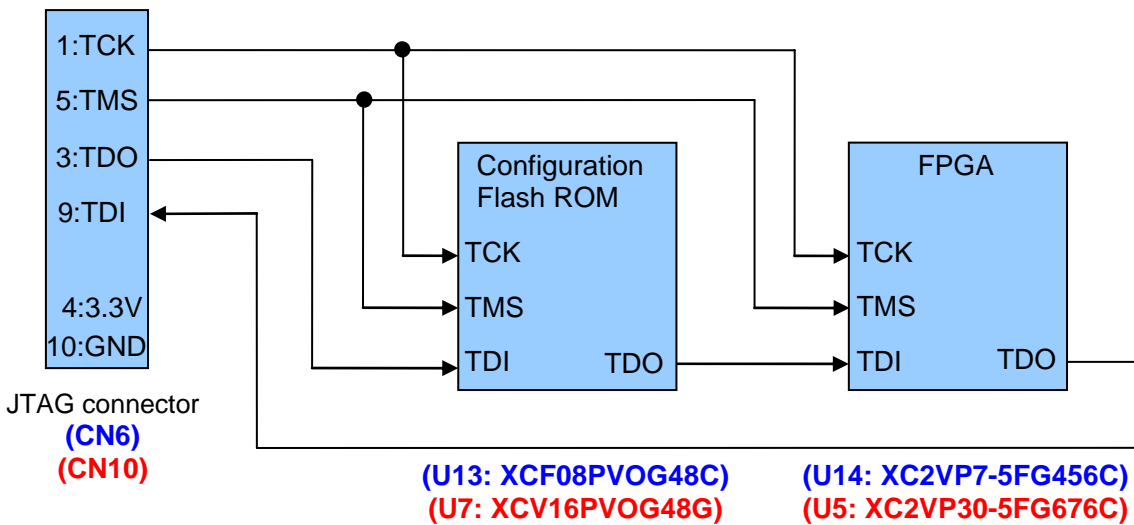

TP15: The 24 MHz clock for the target FPGA.

An external clock for the target FPGA can also be supplied from J3 (SMA connector) for the target FPGA, and the clock is monitored at TP2.

4.3. FPGA Configuration

The figure below shows the connections of the FPGA, a configuration flash ROM, and a JTAG connector.

The pin assignments for CN6 (for the target FPGA) and CN10 (for the control FPGA) are as follows:

CN6, CN10:	Pin 1: TCK	Pin 2: GND
	Pin 3: TDO	Pin 4: 3.3V
	Pin 5: TMS	Pin 6: NC
	Pin 7: NC	Pin 8: NC
	Pin 9: TCI	Pin 10: GND

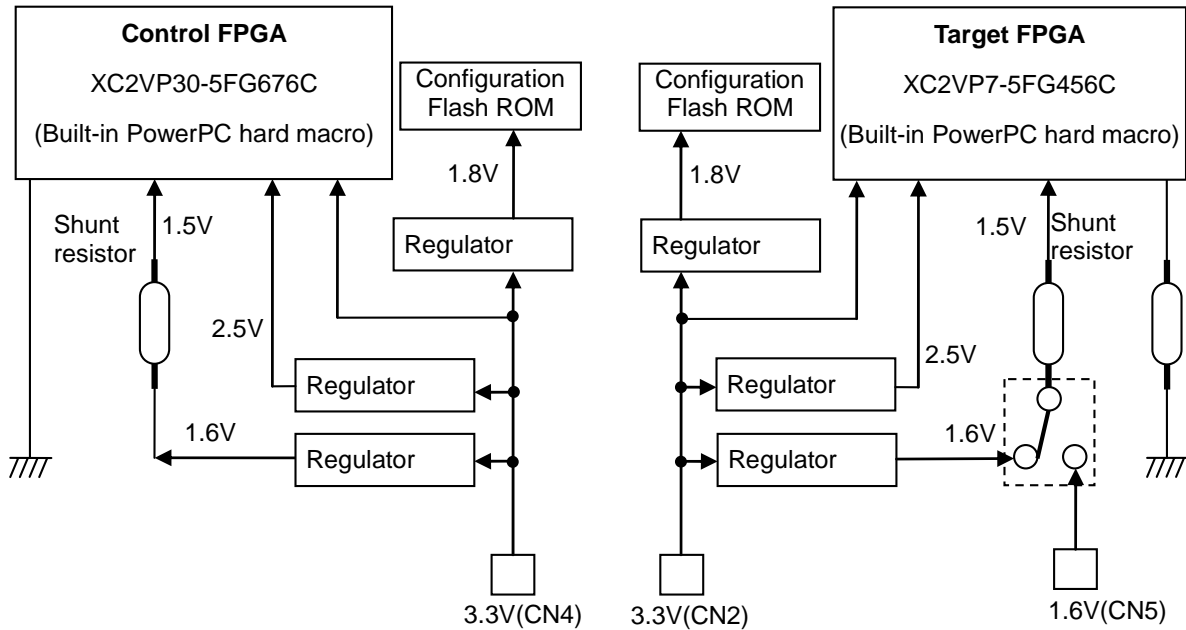

LEDs D4 and D14 are turned on when the target FPGA and control FPGA, respectively, are configured successfully. Configuration mode is set using SW4 and SW8 for the target and control FPGAs, respectively. The default configuration mode is the Master SelectMap Mode. The pin assignments of SW4 and SW8 are follows:

- SW4, SW8: 1: M0 (default: off)
- 2: M1 (default: off)
- 3: M2 (default: on)
- 4: PWRDWN (default: off)
- 5: HSWAP (default: off)
- 6-8: NC

When configuration switch SW2 or SW7 is pushed, the configuration of the target or control FPGA, respectively, is restarted.

4.4. Power Supply

The FPGA board receives 3.3V DC power through connectors CN2 and CN4, and then the internal power regulators generate three voltages of 2.5V, 1.8V, and 1.6V. Alternatively, the 1.6V power for the target FPGA core can be provided from connector CN5.

The pin assignments of connectors CN2, CN4, and CN5 for the 3.3V power supplies and test points TP1 and TP11 for the voltage monitor are described below.

CN2: Power supply to the target FPGA.

- 1: VCC
- 2: GND
- 3: NC

TP1: Test pin to monitor the CN2 voltage.

CN4: Power supply to the control FPGA.

- 1: VCC
- 2: GND
- 3: NC

TP11: Test pin to monitor the CN4 voltage.

Internal 2.5V regulator (TPS72625DCQ)

- TP12: Test pin to monitor the 2.5V power supply for the target FPGA.
- TP23: Test pin to monitor the 2.5V power supply for the control FPGA.

Internal 1.8V regulator (PQ1U181M2ZPH)

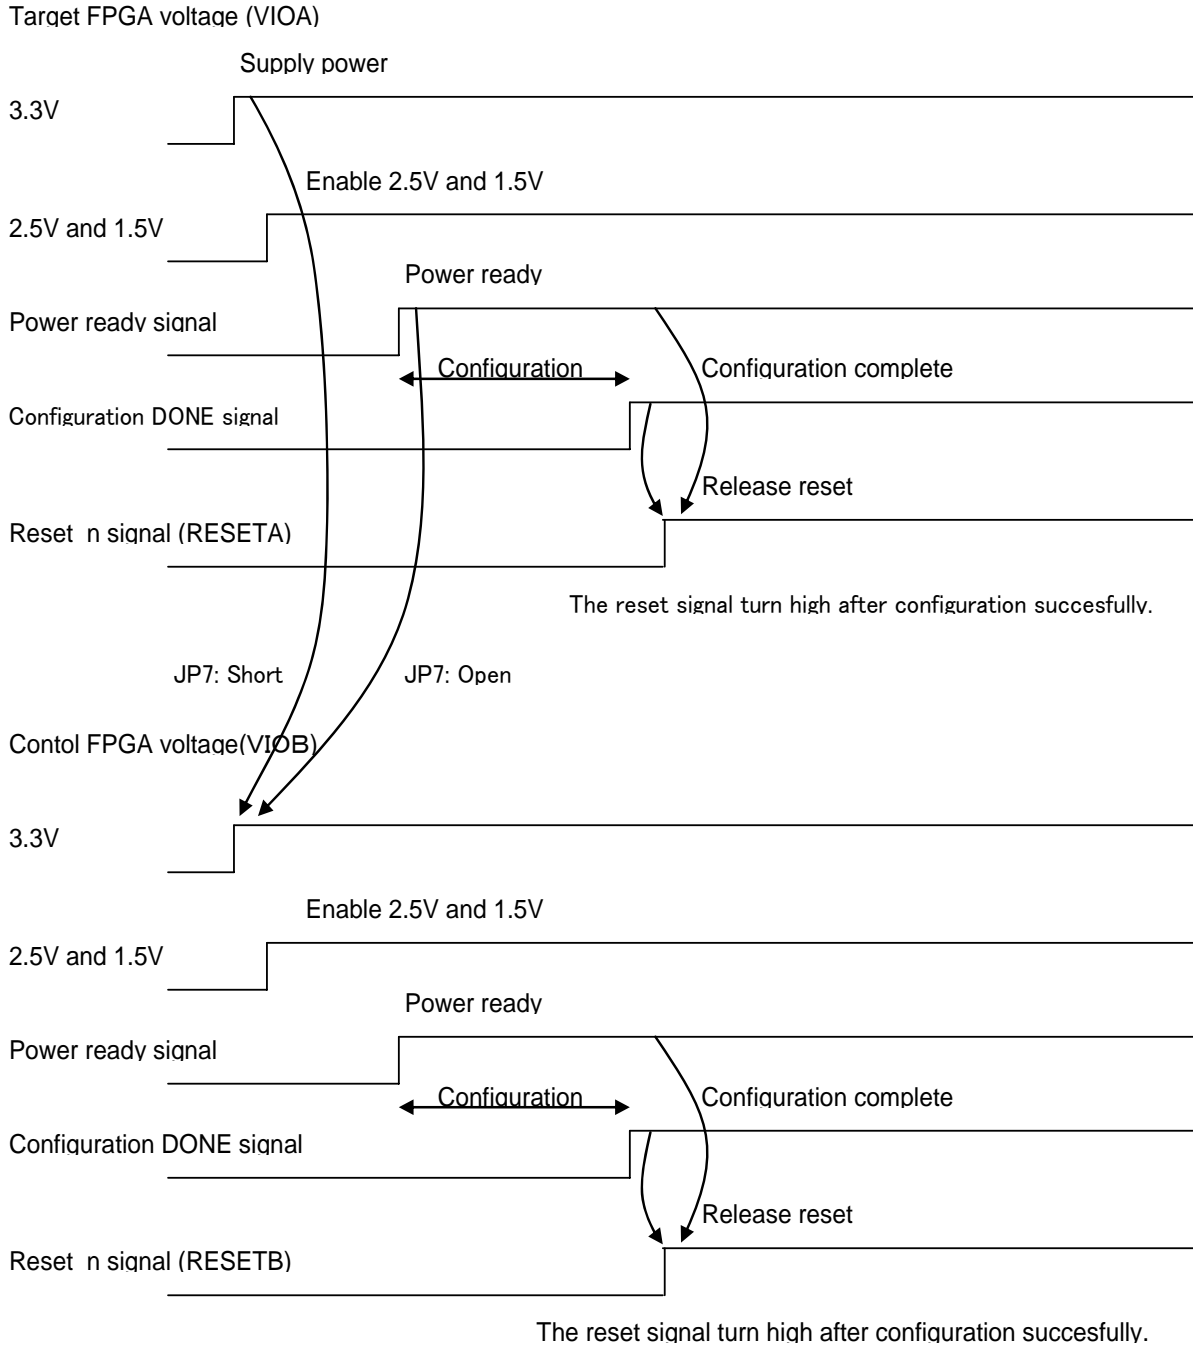

- TP14: Test pin to monitor the 1.8V power supply for the configuration flash ROM dedicated to the target FPGA.
- TP25: Test pin to monitor the 1.8V power supply for the configuration flash ROM dedicated to the control FPGA.

Internal 1.6V regulator (MAX8556ETE)

CN5: Direct power supply for the target FPGA core.

- 1: VCC
- 2: GND
- 3: NC

TP3: Test pin to monitor the 1.6V power supply for the target FPGA core.

4.5. Serial Interface

Use a female-female 9-pin-9-pin RS-232 straight cable to connect the RS-232C port (XM2C-0912-111: OMRON D-Sub male connector) to a host PC.

Signal Name	CN12 (XM2C-0912-111)	U16 (ADM3202ARN)	U5 (XC2VP30-5FG676C)
TX	2pin	14pin	11pin
RX	3pin	13pin	12pin
CTS	8pin	7pin	10pin
RTS	7pin	8pin	9pin

Resistor	ERX1SJ 6R8	Panasonic	2	Appended part
Resistor	ERX1SJ 8R2	Panasonic	2	Appended part

Components in RED are not mounted.

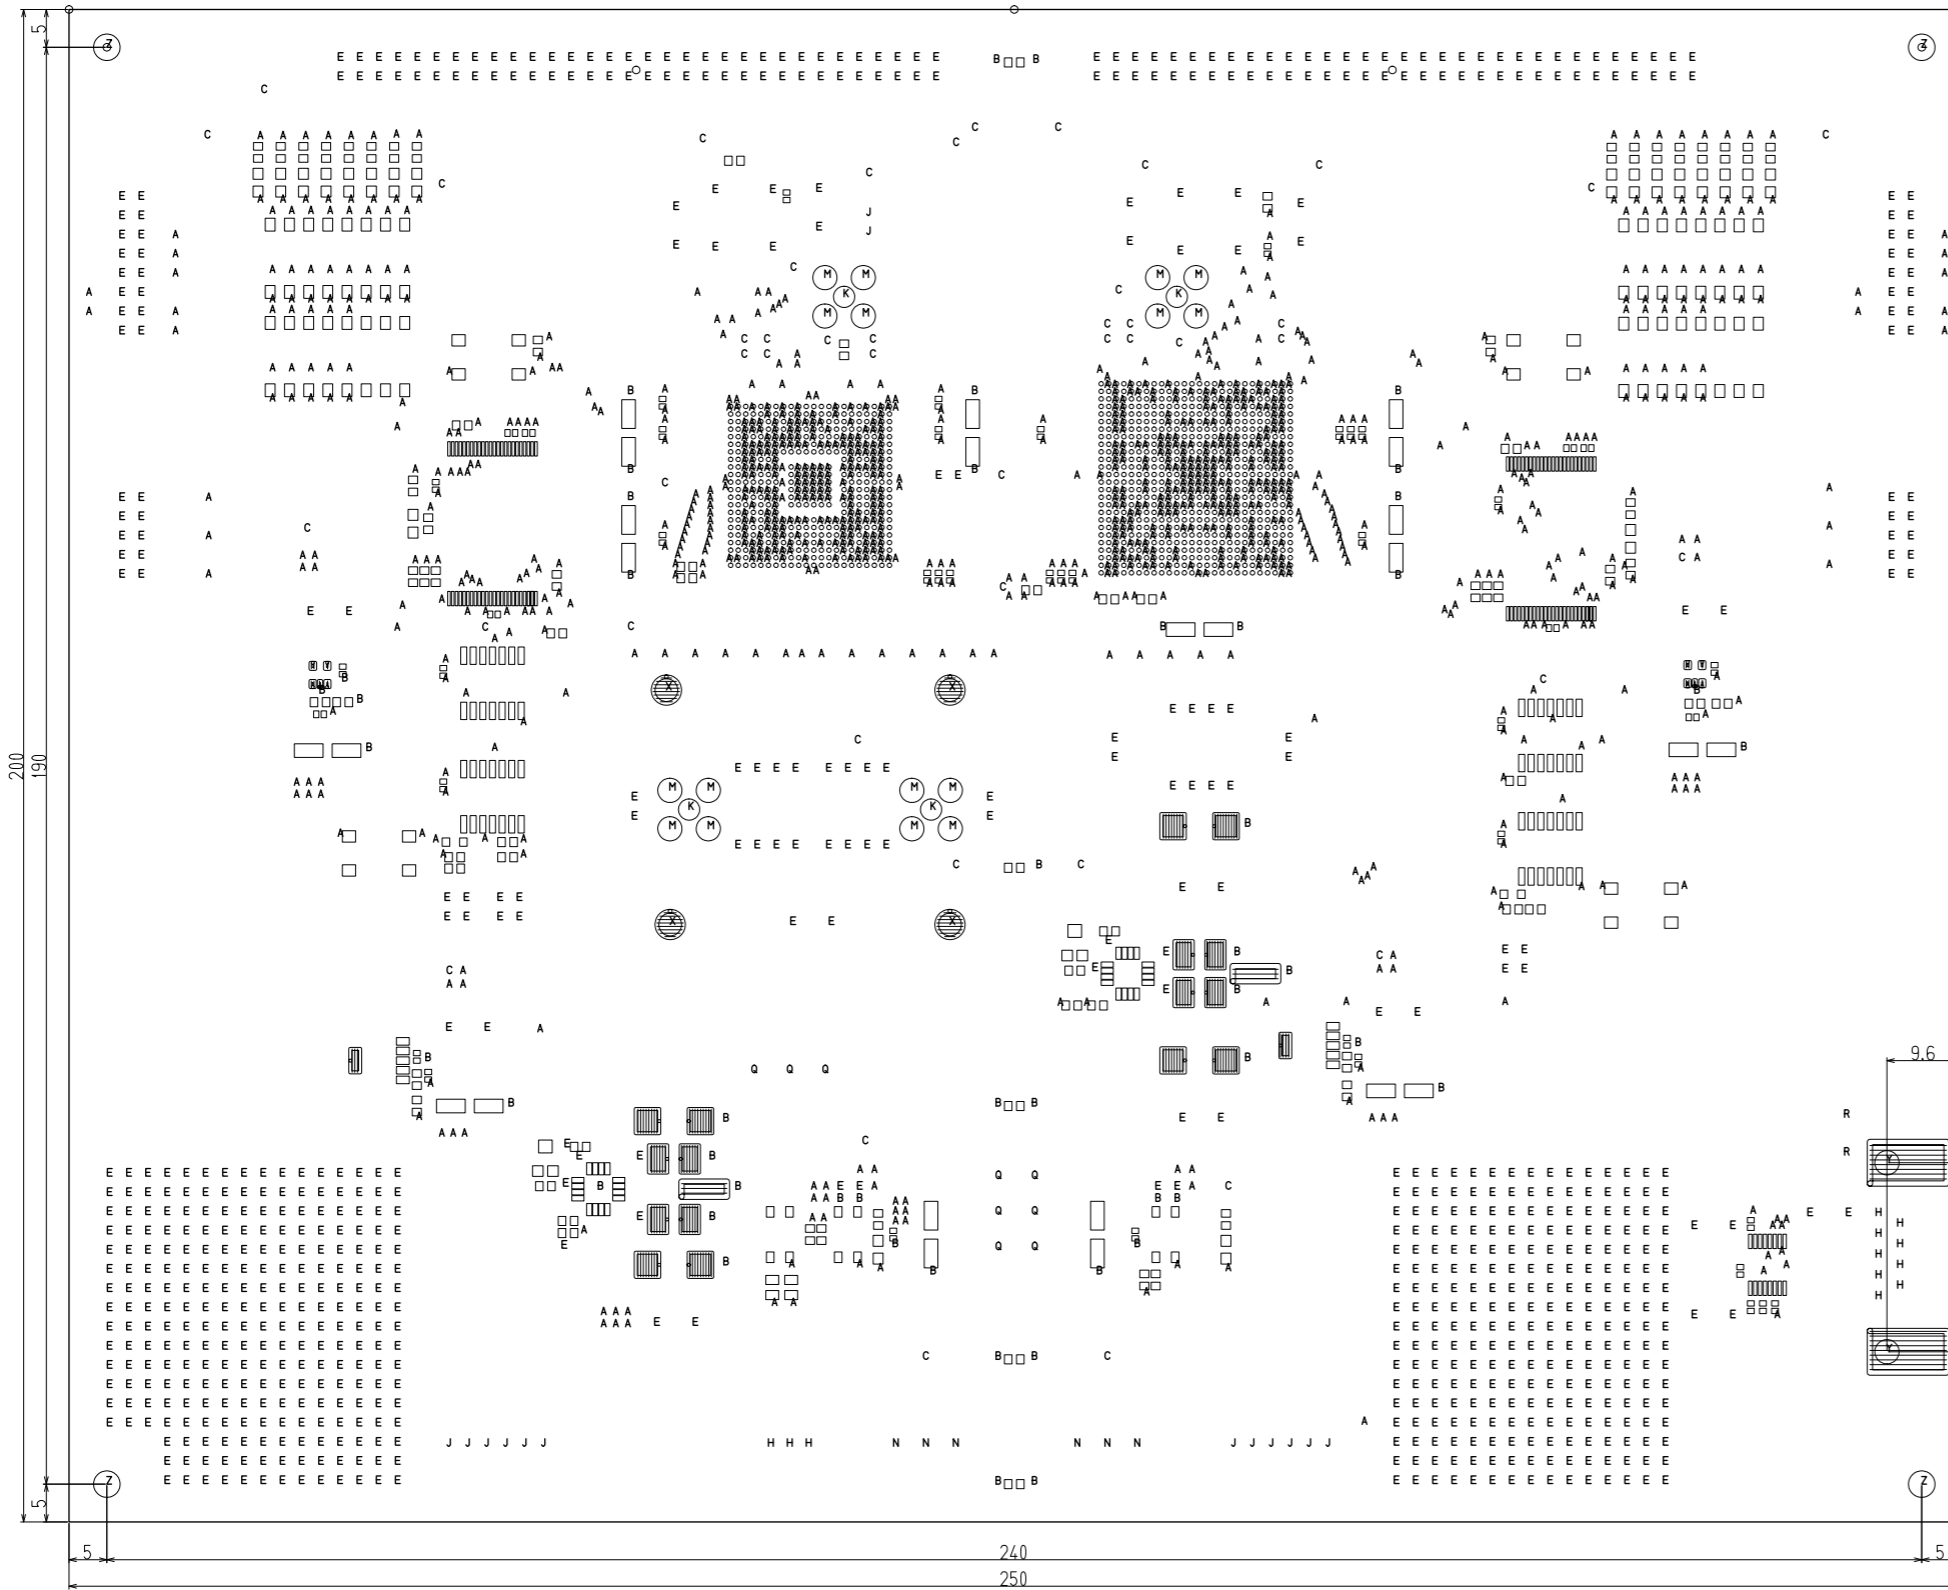

7. Board Information

Specification of the Printed Circuit Board:

Board dimension	---	250 mm x 200 mm x 1.6 mm
Number of layers	---	8 layers
Board material	---	FR-4

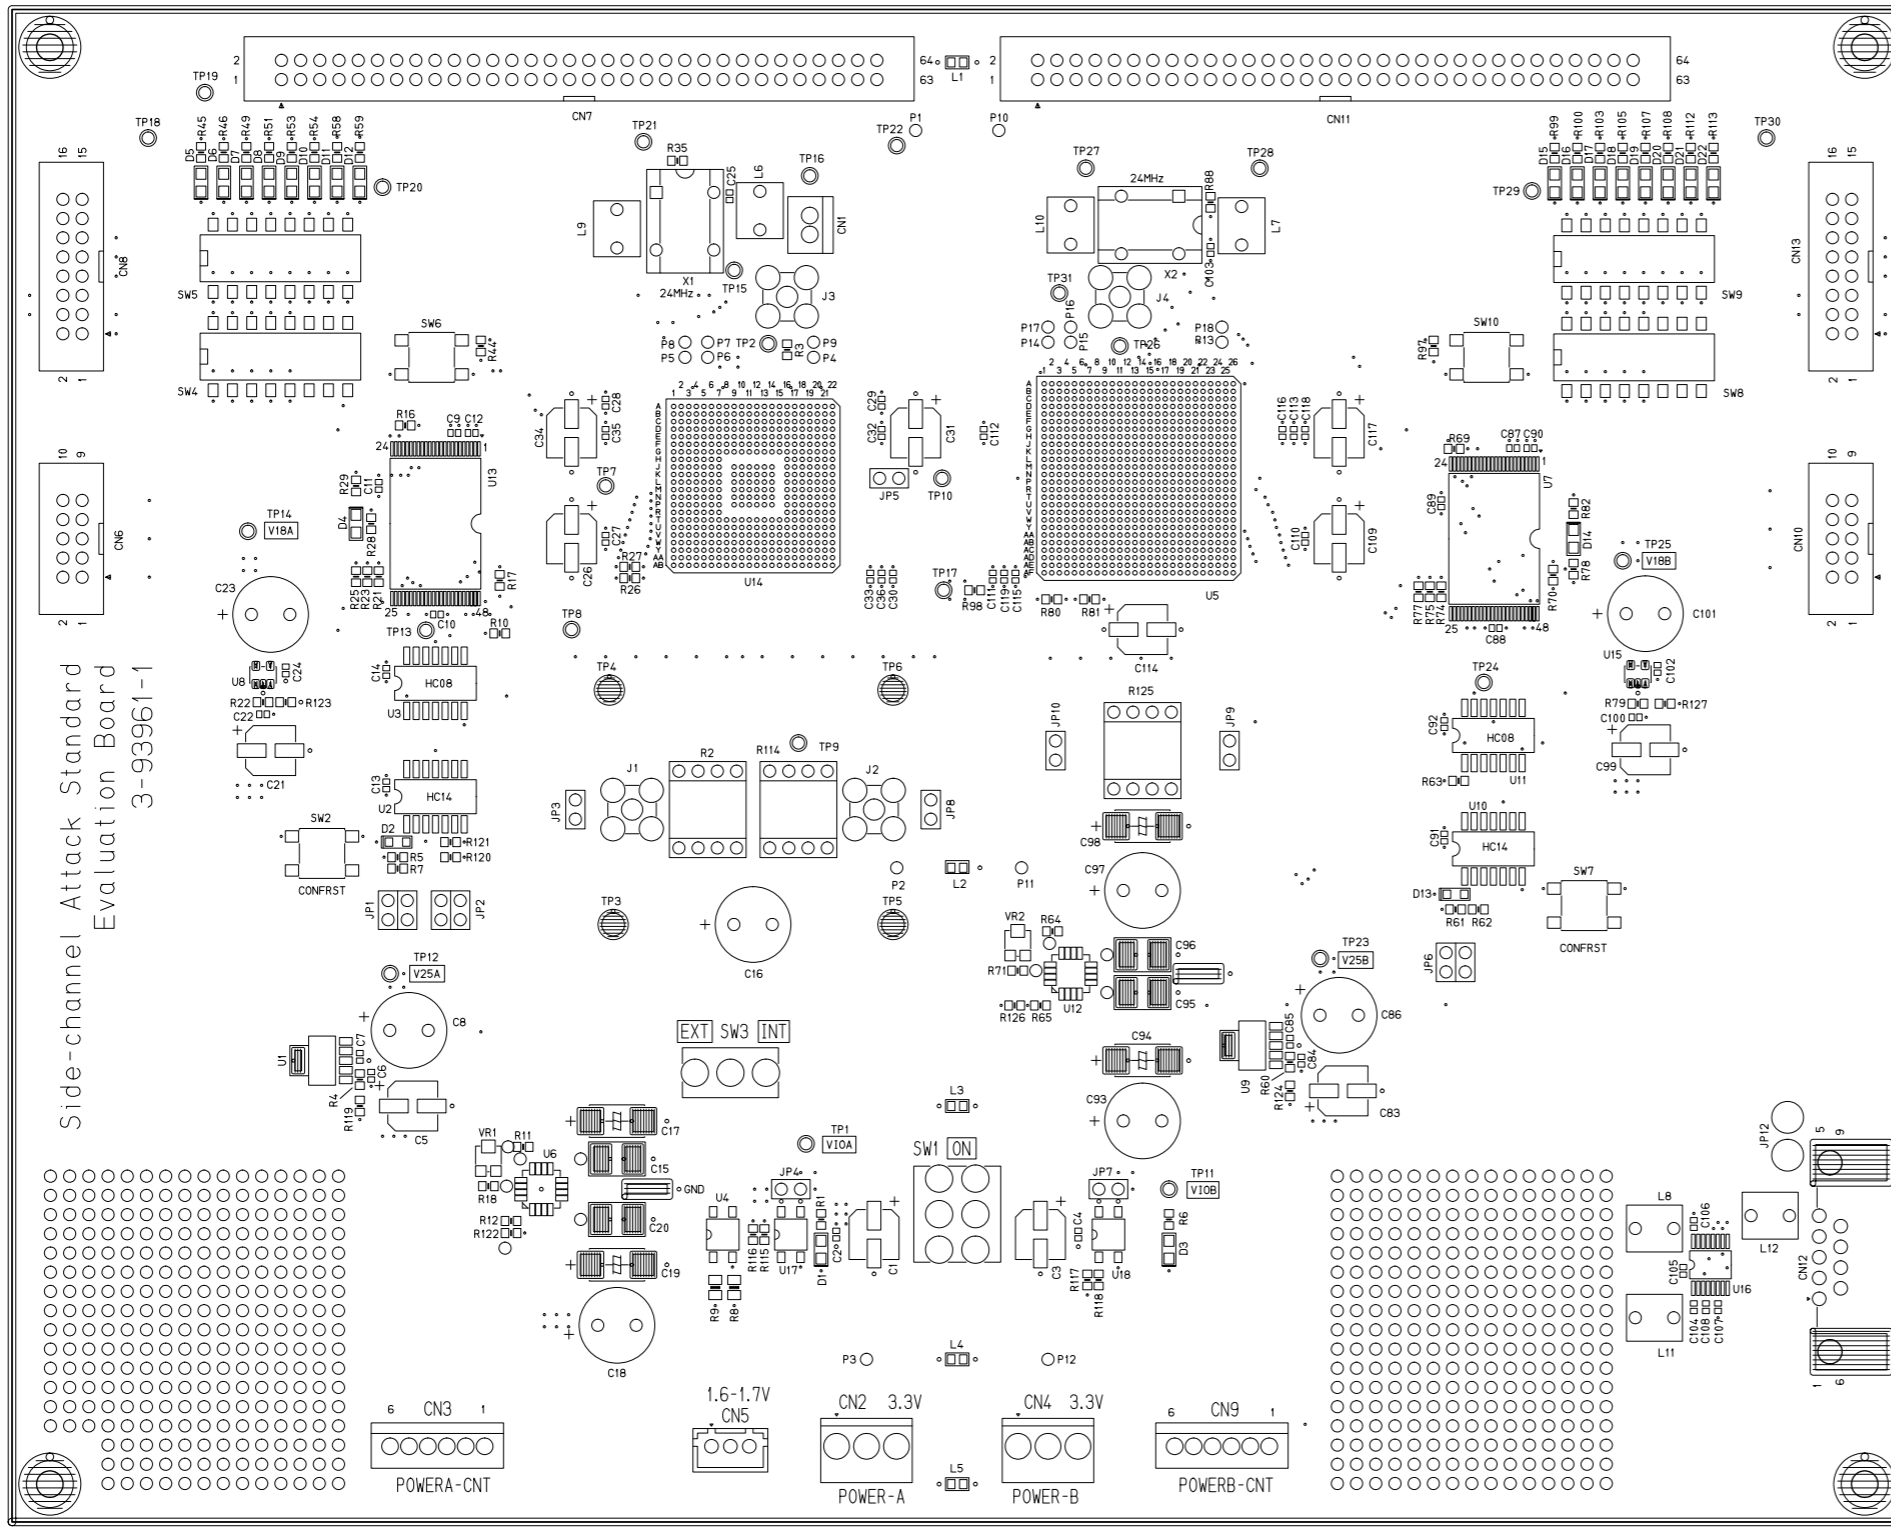

Board Layout Images:

Dimensional drawing	-----	p.26
Part-side drawing	-----	p.27
Solder-side drawing	-----	p.28
Part-side silk screen	-----	p.29
Solder-side silk screen	-----	p.30

form	diameter	number
X	1.6000	4
Y	3.2000	4
Z	3.5000	4
A	0.3000	1027
B	0.5000	50
C	0.8000	45
E	0.9000	756
H	1.0000	12
J	1.2000	14
K	1.5000	7
M	1.7000	16
N	1.8000	6
Q	1.9000	9
R	2.0000	2

8. How to Write Configuration Data to Flash ROM

<Environments>

- ISE must be installed on the host PC.
- A Xilinx download cable is used.
- A proper driver for the download cable is installed in the PC.

<Cable connection>

1. Connect the Xilinx download cable to the PC.
2. Attach a 10-pin to 14-pin conversion connector to the board.
3. Connect the Xilinx download cable and the board with a 14-pin cable.

<Flash ROM data generation>

A Flash ROM data file (MCS) is created by converting a bit stream file with the Xilinx iMPACT tool.

1. Launch iMPACT.
2. Specify the proper project name and location.
3. Select “Prepare a PROM file” from the iMPACT menu, and then press the Next button.
4. Select “Xilinx PROM” as the target and “MCS” as the PROM file format. Enter the file location in the “Location” field, and optionally specify the name of the file in “PROM File Name” field. Press the Next button to go to the next menu.
5. Choose a proper PROM device (xcf08p for the target FPGA or xcf16p for the control FPGA) from the pull-down menu. Press the Add button to add a device and then press the Next button.
6. Check the radio button “File Generation Summary” and click the “Finish” button.
7. The “Add device” menu will appear. Click the “Yes” button.
8. Specify the bit stream file (*.bit) to be converted into the MCS file.
9. The “Add device” menu will appear. However, since there is no device to create a PROM file, select “No” and then click the “OK” button.
10. In the “iMPACT Processes” menu on the left side of the iMPACT window, double click the “Generate File”. The MCS file will be generated.
11. When the message “PROM File Generation Succeeded” appears, the MCS file has been successfully generated.

<PROM file downloading>

1. Launch iMPACT.
2. Select “Configure devices using Boundary-Scan (JTAG)” and click the Finish button.
3. When the message “Identify Succeeded” appears, specify the bit stream file to be configured.
4. If you want to replace the assigned bit stream, click the right button on your mouse and select “Assign New Configuration file”.
5. Right click and select “Program”. Optionally, check the “verify mode” and/or other program properties. Press the “OK” button Configuration of the device will start.
6. If the message “Program Succeeded” appears, the device is successfully configured.
